

# Meta Backend Developer

## By Coursera

### Django Web Framework

#### Design and build a simple Django app

#### Instructions:

By working through the lessons in this course, you've learned the necessary skills and knowledge to create a website in Django by creating a project and an app.

You were provided with code snippets and tasked with using these, plus your own code, to create a website that showcases the menu pages of the Little Lemon restaurant.

Users visit the homepage and can navigate to the pages About, Menu and Book using the main menu.

The menu page contains a list of the menu items that are stored in the database. Each menu item has been added using the Django Administration user interface and contains the following information:

- Name
- Price
- Description
- Image

Each menu item contains a link that displays a dedicated page for the individual item.

#### Review Criteria:

- Does the homepage have a menu link that loads the menu page?
- Does the menu page contain a list of the menu items?
- Are the menu items displayed in alphabetical order?
- Do the menu items display with their associated price?
- Can you click on the menu items to navigate to the menu item page?
- Does the menu item page display all the information for that particular menu item?
- Does the website contain a footer section?
